MODEL LAB · 2026-10-18

Every prior, same slate

The held-out scores that decided which prior is served, then how each one would have ranked today's hitters.

Held-out scores

Fitted on plate appearances before 2026-09-05, scored on the 25,208 that came after (actual HR rate 3.05%). No outcome in the test window was visible during fitting. **Read AUC first** — the slate ranks hitters and takes the top six, so ordering is what matters. Brier and log loss are dominated by the ~3% base rate and barely separate the priors. Metrics are per plate appearance; the probabilities lower down are per game.

PRIOR	AUC	TOP-DECILE LIFT	BRIER	LOG LOSS	CAL. RMSE
Flat league League HR rate as the prior for every hitter.	0.5829	1.70×	0.02952	0.13558	0.00606
KNN comps Prior is the pooled rate of the nearest comparables.	0.6079	1.59×	0.02946	0.13424	0.00402
SVR Support-vector regression on the same feature matrix.	0.6017	1.52×	0.02948	0.13476	0.00534
Random forest Forest regression; a learned similarity metric.	0.6026	1.55×	0.02947	0.13434	0.00442
Core (KNN+SVR) Blend of KNN and SVR, no forest.	0.6079	1.59×	0.02946	0.13424	0.00402
Forest blend KNN + SVR + forest, weights fitted out-of-fold.	0.6079	1.59×	0.02946	0.13424	0.00402
Linear regression Ordinary least squares on the same features.	0.6052	1.61×	0.02948	0.13453	0.00385
Logistic regression Binomial logistic on the per-PA home run outcome.	0.6060	1.63×	0.02949	0.13456	0.00511
Neural net (torch) Two-layer PyTorch MLP, PA-weighted, trained on the same features.	0.6048	1.60×	0.02947	0.13438	0.00493
XGBoost Gradient-boosted trees, depth 3 with subsampling and L2.	0.6023	1.59×	0.02948	0.13452	0.00485

Thin-sample subset

The same held-out window, restricted to hitters with fewer than 100 plate appearances before the cutoff (2,707 PA, actual HR rate 2.44%). For a regular with 600 PA the observed record swamps any prior, so the priors mostly separate here.

Per-game probabilities: each prior's per-PA rate run through this hitter's own plate appearances, park, weather, bullpen and times-through-the-order terms. Only the prior changes across the columns — every other term is held fixed, so a left-to-right spread is the prior disagreeing about the hitter, not the context. Shading grows with the probability.
