MODEL LAB · 2026-10-17

Every prior, same slate

The held-out scores that decided which prior is served, then how each one would have ranked today's hitters.

Served (full season)	11	26,271	3.07%	0.6059
served prior	priors compared	held-out plate appearances	held-out HR rate	best AUC · KNN comps

Held-out scores

Fitted on plate appearances before 2026-09-04, scored on the 26,271 that came after (actual HR rate 3.07%). No outcome in the test window was visible during fitting. **Read AUC first** — the slate ranks hitters and takes the top six, so ordering is what matters. Brier and log loss are dominated by the ~3% base rate and barely separate the priors. Metrics are per plate appearance; the probabilities lower down are per game.

PRIOR	AUC	TOP-DECILE LIFT	BRIER	LOG LOSS	CAL. RMSE
Flat league League HR rate as the prior for every hitter.	0.5794	1.65×	0.02968	0.13619	0.00571
KNN comps Prior is the pooled rate of the nearest comparables.	0.6059	1.56×	0.02962	0.13488	0.00390
SVR Support-vector regression on the same feature matrix.	0.5972	1.58×	0.02967	0.13558	0.00596
Random forest Forest regression; a learned similarity metric.	0.5982	1.53×	0.02964	0.13516	0.00523
Core (KNN+SVR) Blend of KNN and SVR, no forest.	0.6059	1.56×	0.02962	0.13488	0.00390
Forest blend KNN + SVR + forest, weights fitted out-of-fold.	0.6059	1.56×	0.02962	0.13488	0.00390
Linear regression Ordinary least squares on the same features.	0.6017	1.58×	0.02965	0.13518	0.00398
Logistic regression Binomial logistic on the per-PA home run outcome.	0.6027	1.65×	0.02966	0.13524	0.00623
Neural net (torch) Two-layer PyTorch MLP, PA-weighted, trained on the same features.	0.6007	1.60×	0.02964	0.13512	0.00470
XGBoost Gradient-boosted trees, depth 3 with subsampling and L2.	0.5988	1.58×	0.02966	0.13527	0.00582

Thin-sample subset

The same held-out window, restricted to hitters with fewer than 100 plate appearances before the cutoff (2,786 PA, actual HR rate 2.37%). For a regular with 600 PA the observed record swamps any prior, so the priors mostly separate here.

Per-game probabilities: each prior's per-PA rate run through this hitter's own plate appearances, park, weather, bullpen and times-through-the-order terms. Only the prior changes across the columns — every other term is held fixed, so a left-to-right spread is the prior disagreeing about the hitter, not the context. Shading grows with the probability.
