Context only — this feeds none of the projections above. The largest batter-vs-pitcher sample all season is 13 plate appearances, and only about 520 pairs reach even 8. At that size the standard error on a hit rate is roughly .16, wider than the entire spread of true talent between major-league hitters. A 4-for-9 line is noise that looks like a trend, so it is shown with its sample size attached and deliberately kept out of the model.

Read AUC first. The slate ranks hitters and takes the top six, so ordering is what matters; AUC asks whether home runs were ranked above non-home-runs. Per-PA Brier and log loss are dominated by the ~3% base rate and barely separate the models. Metrics are per plate appearance, while the probabilities above are per game.
