MODEL LAB · 2026-10-24

Every prior, same slate

The held-out scores that decided which prior is served, then how each one would have ranked today's hitters.

Held-out scores

Fitted on plate appearances before 2026-09-10, scored on the 20,133 that came after (actual HR rate 2.97%). No outcome in the test window was visible during fitting. **Read AUC first** — the slate ranks hitters and takes the top six, so ordering is what matters. Brier and log loss are dominated by the ~3% base rate and barely separate the priors. Metrics are per plate appearance; the probabilities lower down are per game.

PRIOR	AUC	TOP-DECILE LIFT	BRIER	LOG LOSS	CAL. RMSE
Flat league League HR rate as the prior for every hitter.	0.5832	1.51×	0.02872	0.13267	0.00563
KNN comps Prior is the pooled rate of the nearest comparables.	0.6009	1.63×	0.02868	0.13158	0.00464
SVR Support-vector regression on the same feature matrix.	0.5952	1.44×	0.02871	0.13232	0.00600
Random forest Forest regression; a learned similarity metric.	0.5980	1.54×	0.02869	0.13175	0.00464
Core (KNN+SVR) Blend of KNN and SVR, no forest.	0.6009	1.63×	0.02868	0.13158	0.00464
Forest blend KNN + SVR + forest, weights fitted out-of-fold.	0.6009	1.63×	0.02868	0.13158	0.00464
Linear regression Ordinary least squares on the same features.	0.5974	1.57×	0.02869	0.13193	0.00514
Logistic regression Binomial logistic on the per-PA home run outcome.	0.5975	1.63×	0.02871	0.13204	0.00552
Neural net (torch) Two-layer PyTorch MLP, PA-weighted, trained on the same features.	0.5976	1.63×	0.02869	0.13188	0.00543
XGBoost Gradient-boosted trees, depth 3 with subsampling and L2.	0.5960	1.54×	0.02870	0.13212	0.00552

Thin-sample subset

The same held-out window, restricted to hitters with fewer than 100 plate appearances before the cutoff (1,884 PA, actual HR rate 2.44%). For a regular with 600 PA the observed record swamps any prior, so the priors mostly separate here.

Per-game probabilities: each prior's per-PA rate run through this hitter's own plate appearances, park, weather, bullpen and times-through-the-order terms. Only the prior changes across the columns — every other term is held fixed, so a left-to-right spread is the prior disagreeing about the hitter, not the context. Shading grows with the probability.
