MODEL LAB · 2026-10-14

Every prior, same slate

The held-out scores that decided which prior is served, then how each one would have ranked today's hitters.

Held-out scores

Fitted on plate appearances before 2026-09-02, scored on the 27,888 that came after (actual HR rate 3.04%). No outcome in the test window was visible during fitting. **Read AUC first** — the slate ranks hitters and takes the top six, so ordering is what matters. Brier and log loss are dominated by the ~3% base rate and barely separate the priors. Metrics are per plate appearance; the probabilities lower down are per game.

PRIOR	AUC	TOP-DECILE LIFT	BRIER	LOG LOSS	CAL. RMSE
Flat league League HR rate as the prior for every hitter.	0.5744	1.58×	0.02943	0.13530	0.00505
KNN comps Prior is the pooled rate of the nearest comparables.	0.5974	1.56×	0.02939	0.13431	0.00513
SVR Support-vector regression on the same feature matrix.	0.5901	1.50×	0.02944	0.13515	0.00667
Random forest Forest regression; a learned similarity metric.	0.5923	1.51×	0.02942	0.13464	0.00598
Core (KNN+SVR) Blend of KNN and SVR, no forest.	0.5974	1.56×	0.02939	0.13431	0.00513
Forest blend KNN + SVR + forest, weights fitted out-of-fold.	0.5966	1.51×	0.02939	0.13431	0.00544
Linear regression Ordinary least squares on the same features.	0.5917	1.50×	0.02943	0.13478	0.00562

Thin-sample subset

The same held-out window, restricted to hitters with fewer than 100 plate appearances before the cutoff (3,279 PA, actual HR rate 2.29%). For a regular with 600 PA the observed record swamps any prior, so the priors mostly separate here.

Per-game probabilities: each prior's per-PA rate run through this hitter's own plate appearances, park, weather, bullpen and times-through-the-order terms. Only the prior changes across the columns — every other term is held fixed, so a left-to-right spread is the prior disagreeing about the hitter, not the context. Shading grows with the probability.
