Held-out scores

Fitted on plate appearances before 2026-08-28, scored on the 32,276 that came after (actual HR rate 3.05%). No outcome in the test window was visible during fitting. **Read AUC first** — the slate ranks hitters and takes the top six, so ordering is what matters. Brier and log loss are dominated by the ~3% base rate and barely separate the priors. Metrics are per plate appearance; the probabilities lower down are per game.

PRIOR	AUC	TOP-DECILE LIFT	BRIER	LOG LOSS	CAL. RMSE
Flat league League HR rate as the prior for every hitter.	0.5845	1.53×	0.02950	0.13547	0.00447
KNN comps Prior is the pooled rate of the nearest comparables.	0.6001	1.50×	0.02946	0.13452	0.00426

Thin-sample subset

The same held-out window, restricted to hitters with fewer than 100 plate appearances before the cutoff (3,511 PA, actual HR rate 2.36%). For a regular with 600 PA the observed record swamps any prior, so the priors mostly separate here.

Per-game probabilities: each prior's per-PA rate run through this hitter's own plate appearances, park, weather, bullpen and times-through-the-order terms. Only the prior changes across the columns — every other term is held fixed, so a left-to-right spread is the prior disagreeing about the hitter, not the context. Shading grows with the probability.
