

Every prior, same slate

The held-out scores that decided which prior is served, then how each one would have ranked today's hitters.

Held-out scores

Fitted on plate appearances before 2026-08-27, scored on the 32,641 that came after (actual HR rate 3.05%). No outcome in the test window was visible during fitting. **Read AUC first** — the slate ranks hitters and takes the top six, so ordering is what matters. Brier and log loss are dominated by the ~3% base rate and barely separate the priors. Metrics are per plate appearance; the probabilities lower down are per game.

PRIOR	AUC	TOP-DECILE LIFT	BRIER	LOG LOSS	CAL. RMSE
Flat league League HR rate as the prior for every hitter.	0.5836	1.55×	0.02952	0.13556	0.00462
KNN comps Prior is the pooled rate of the nearest comparables.	0.5999	1.52×	0.02949	0.13463	0.00494
SVR Support-vector regression on the same feature matrix.	0.5969	1.48×	0.02953	0.13522	0.00618
Random forest Forest regression; a learned similarity metric.	0.5958	1.47×	0.02952	0.13504	0.00551
Core (KNN+SVR) Blend of KNN and SVR, no forest.	0.5999	1.52×	0.02949	0.13463	0.00494
Forest blend KNN + SVR + forest, weights fitted out-of-fold.	0.5999	1.52×	0.02949	0.13463	0.00494
Linear regression Ordinary least squares on the same features.	0.5965	1.47×	0.02951	0.13498	0.00436
Logistic regression Binomial logistic on the per-PA home run outcome.	0.5976	1.54×	0.02953	0.13512	0.00680
Neural net (torch) Two-layer PyTorch MLP, PA-weighted, trained on the same features.	0.5964	1.46×	0.02951	0.13496	0.00557

Thin-sample subset

The same held-out window, restricted to hitters with fewer than 100 plate appearances before the cutoff (3,547 PA, actual HR rate 2.34%). For a regular with 600 PA the observed record swamps any prior, so the priors mostly separate here.

Per-game probabilities: each prior's per-PA rate run through this hitter's own plate appearances, park, weather, bullpen and times-through-the-order terms. Only the prior changes across the columns — every other term is held fixed, so a left-to-right spread is the prior disagreeing about the hitter, not the context. Shading grows with the probability.
