MODEL LAB · 2026-10-19

Every prior, same slate

The held-out scores that decided which prior is served, then how each one would have ranked today's hitters.

Served (full season)	11	24,115	3.04%	0.6080
served prior	priors compared	held-out plate appearances	held-out HR rate	best AUC · KNN comps

Held-out scores

Fitted on plate appearances before 2026-09-06, scored on the 24,115 that came after (actual HR rate 3.04%). No outcome in the test window was visible during fitting. **Read AUC first** — the slate ranks hitters and takes the top six, so ordering is what matters. Brier and log loss are dominated by the ~3% base rate and barely separate the priors. Metrics are per plate appearance; the probabilities lower down are per game.

PRIOR	AUC	TOP-DECILE LIFT	BRIER	LOG LOSS	CAL. RMSE
Flat league League HR rate as the prior for every hitter.	0.5898	1.67×	0.02937	0.13496	0.00609
KNN comps Prior is the pooled rate of the nearest comparables.	0.6080	1.57×	0.02932	0.13372	0.00385
SVR Support-vector regression on the same feature matrix.	0.6031	1.60×	0.02934	0.13424	0.00490
Random forest Forest regression; a learned similarity metric.	0.6048	1.60×	0.02932	0.13379	0.00336
Core (KNN+SVR) Blend of KNN and SVR, no forest.	0.6080	1.57×	0.02932	0.13372	0.00385
Forest blend KNN + SVR + forest, weights fitted out-of-fold.	0.6080	1.57×	0.02932	0.13372	0.00385
Linear regression Ordinary least squares on the same features.	0.6065	1.60×	0.02934	0.13395	0.00406
Logistic regression Binomial logistic on the per-PA home run outcome.	0.6059	1.64×	0.02936	0.13406	0.00525
Neural net (torch) Two-layer PyTorch MLP, PA-weighted, trained on the same features.	0.6051	1.60×	0.02933	0.13387	0.00397
XGBoost Gradient-boosted trees, depth 3 with subsampling and L2.	0.6041	1.58×	0.02933	0.13393	0.00438

Thin-sample subset

The same held-out window, restricted to hitters with fewer than 100 plate appearances before the cutoff (2,467 PA, actual HR rate 2.39%). For a regular with 600 PA the observed record swamps any prior, so the priors mostly separate here.

Per-game probabilities: each prior's per-PA rate run through this hitter's own plate appearances, park, weather, bullpen and times-through-the-order terms. Only the prior changes across the columns — every other term is held fixed, so a left-to-right spread is the prior disagreeing about the hitter, not the context. Shading grows with the probability.
